

New app to track bicycle maintenance, receive alerts and analyze how long components last.

The app solves most limitations with existing solutions: it allows to register all component's history (from bikes installations to services and rides) and define multiple maintenance intervals based on distance, moving time and elapsed time. It also integrates with Strava to determine actual usage.

March 11, 2018 — Available today, the app ProBikeGarage offers most demanding cyclists a way to **keep track of** all their **bikes** and **components** usage, and **receive alerts** when **components need maintenance** or **replacement**. It also allows to **analyze how long components last** and how wear and different maintenances affect athlete performance.

The app integrates with Strava so you only have to sign-in with your account and import your bikes and previous rides. Then you can define as many components as you need and install them in the corresponding bikes, so **mileage and hours are updated using previous and future rides**.

In addition multiple service intervals can be defined to **alert you when a component needs maintenance** or **replacement** based on its distance, moving time and elapsed time.

A component can be defined when you acquire it if you want to **track all its lifecycle**, or just at the end of its life to **analyze how long it lasted**.

The app also allows to define **multiple setups for the same bike** so you don't have to switch components manually for different types of rides (indoor, outdoor, workout, race, ...).

"We started developing a simple maintenance app that allowed us to receive maintenance notifications by moving time instead of only distance, and we ended up with the most complete solution for bike maintenance!" said Jaime Gil, developer and founder of ProBikeGarage.

ProBikeGarage is **available for free** and world-wide on Google Play for devices with Android 4.4 or higher. iOS and web version are under active development as well, and will be available soon.
